BETTER
PATIENT
OUTCOMES
THROUGH
MSKIT®

Minimally Stimulated Ketamine Infusion Therapy (MSKIT®) is a best practice method of distributing ketamine for a variety of conditions. Scenic City Neurotherapy utilizes MSKIT® protocols exclusively for our patients.

Why is Minimally Stimulated Ketamine Infusion Therapy (MSKIT®) Better?

Optimal dosing

100% bioavailability

Safer, more controlled administration

Ability to titrate accurately

Science-based instead of experientially-based

Patients report increased comfort and decreased anxiety during treatment

MSKIT® Results in Neuro-Optimization

These factors allow for the optimal release of neuro-regenerative proteins (BDNF) which are responsible for the antidepressant effect. In other words, MSKIT® produces an environment that minimizes stimulation and will assist the brain in reaching a theta wave state that facilitates an ideal release of brain-derived neurotrophic factor (BDNF), leading to neuro-optimization. Neuro-optimization is why Ketamine Infusion Therapy works.

Subscribe to MSKIT® Protocols for Better Patient Outcomes

The MSKIT® consultation process educates and prepares patients for treatment, yielding a 90% conversion rate when executed properly.

For mood disorders, MSKIT® produces up to 15% better patient reported outcomes compared to Ketamine Assisted Psychotherapy.

For neuropathic pains treated with chronic opioid therapy, a patient's worst reported day without opioid medication is significantly better than his or her best reported day while taking opioids 100% of the time after withdrawal is complete.

MSKIT® offers your patients a research-based treatment option that will address both physiological and psychological needs to optimally process and feel their world correctly.

Interested in learning how you can provide better outcomes for your patients through MSKIT®? Our MSKIT® Certification Program is coming soon! It will provide you the tools and guidance needed to bring this best practice to your clinic.
